K
per mouse (n=8)
log2 ratio, per mouse
unmatched
matched
The effect is not robust
spatially av. (unmatched) −0.090
time av. (unmatched) −0.028
time av. SPEED-MATCHED +0.036
Three measures of the same quantity,
same cells, all "significant", two signs.
A ~3% difference that reverses under a
change of denominator and a behavioural
control is not a rate effect.
Anchoring is about WHERE cells fire,
not how much.
