
A
M26 D18 — one session, trial by trial
anchored
non-anchored
population axis (PC1, z)
B
frequency (Hz)
power (z per frequency)
C
theta 6–10
slow gamma 30–48
fast gamma 60–100
band power (z)
D
theta–fast-gamma MI ×10^3
theta–slow-gamma MI ×10^3
trial
E
the two states, as spectra and as deviations
(26 switching sessions)
spectrum
non-anchored
anchored
same shape — no gain change
deviation (z)
the bands F quantifies
frequency (Hz)
F
the difference changes SIGN — not a gain change
anchored − non (z)

0.020
0.280
0.001
0.031
delta
theta
beta
slow gamma
high gamma
G
only FAST gamma
uncouples
theta–gamma MI
over shuffle null
p=0.71
5e-6
slow
30–55*
fast
60–100
* contains mains
H
power moves from fast to slow,
with no net change
equal and
opposite
fast gamma change (z)
slow gamma change (z)
the difference is reliable;
the sum and the broadband are not
z, anchored − non
